

Performance User Guide

PrestaShop module · Compatible with PrestaShop 1.7, 8 and 9

A faster store **with one toggle at a time**

Performance speeds up your shop with WebP delivery (safe original fallback), lazy loading, CSS/JS minify and combine, browser-cache headers, preload/preconnect hints and non-destructive database maintenance. Every optimization has its own switch, so you can turn on exactly what your theme supports and leave the rest off. No coding, no theme edits.

1. Installation

1. In the back office go to **Modules** → **Module Manager** → **Upload a module** and select the module ZIP.
2. Once installed, click **Configure** to open the setup wizard.

Updates are automatic. They are tied to your domain — no licence key to enter. Development domains (`.local` , `.test` , `localhost`) are always allowed. When a new version is available it is shown right inside the module.

2. Configuration — step by step

The Configure screen is a single page: a status panel, the per-optimization settings, action buttons and a database-cleanup tool.

Status

A read-only health panel shown at the top of the page.

- **Master switch** — whether optimizations are currently ON or OFF.
- **WebP engine (GD/Imagick)** — whether the server can generate WebP. If not available, WebP rewriting is simply skipped.
- **WebP cache directory writable** — whether generated WebP files can be stored.
- **Browser-cache .htaccess block** — whether the cache rules are currently written.

Master switch: **ON**

WebP engine (GD/Imagick): **available**

WebP cache directory writable: **ON**

Browser-cache .htaccess block: **OFF**

General & Images

Status — server capabilities at a glance

General & Images master switch

The master switch plus all image optimizations.

- **Enable optimizations** — master switch. Off = the module does nothing on the front office.
- **Serve WebP** — wraps images in `<picture>` with a WebP source and the original as fallback.
- **Lazy-load images / Lazy-load iframes/videos** — add `loading="lazy"` where it is missing.
- **IntersectionObserver fallback** — tiny script for old browsers without native lazy loading.
- **Add missing dimensions** — best-effort width/height to reduce layout shift (heavier).
- **WebP quality (1-100)** — the compression quality used when generating WebP.

<input checked="" type="checkbox"/> Enable optimizations Master switch. Off = the module does nothing on the front office.	<input checked="" type="checkbox"/> Serve WebP Wrap images in <code><picture></code> with a WebP source and the original as fallback.	<input checked="" type="checkbox"/> Lazy-load images Add <code>loading="lazy"</code> to images that do not declare it.
<input checked="" type="checkbox"/> Lazy-load iframes/videos Add <code>loading="lazy"</code> to iframes (maps, embeds, videos).	<input checked="" type="checkbox"/> IntersectionObserver fallback Tiny script for old browsers without native lazy loading.	<input type="checkbox"/> Add missing dimensions Best-effort width/height to reduce layout shift (heavier).
WebP quality (1-100) <input type="text" value="82"/>

General & Images — master switch, WebP and lazy loading

CSS / JS / HTML

Minify, combine and defer your assets. The "invasive" options are off by default — test them on your theme.

- **Minify CSS / Minify JS** — use PrestaShop's native per-file cache (safe).
- **Combine CSS (invasive) / Combine JS (invasive)** — off by default; can break some themes, test before enabling.
- **Defer JS** — adds `defer` to non-critical scripts.
- **Move JS to footer** — opt-in, theme dependent.
- **Minify HTML (invasive)** — collapses whitespace; preserves `pre/textarea/script/style`.
- **Exclusions** — one fragment per line; any asset URL or image src containing one of these is left untouched.

<input checked="" type="checkbox"/> Minify CSS Uses PrestaShop native per-file CSS cache (safe).	<input checked="" type="checkbox"/> Minify JS Uses PrestaShop native per-file JS cache (safe).	<input type="checkbox"/> Combine CSS (invasive) Off by default. Can break some themes - test before enabling.
<input type="checkbox"/> Combine JS (invasive) Off by default. Can break some themes - test before enabling.	<input type="checkbox"/> Defer JS Opt-in. Adds defer to non-critical scripts.	<input type="checkbox"/> Move JS to footer Opt-in, theme dependent.
<input type="checkbox"/> Minify HTML (invasive) Off by default. Collapses whitespace; preserves <code>pre/textarea/script/style</code> .		
Exclusions (one fragment per line) Any asset URL or image src containing one of these fragments is left untouched. <input type="text"/>		
⚡ Preload / Preconnect		

CSS / JS / HTML — minify, combine, defer and exclusions

Preload / Preconnect

Add resource hints to speed up the first render.

- **Preload** — one URL per line for fonts/critical assets. The `as` attribute is detected from the extension.
- **Preconnect** — one origin per line, e.g. `https://fonts.gstatic.com`.

Preload (one URL per line) Fonts/critical assets. The "as" attribute is detected from the extension. <input type="text"/>
Preconnect (one origin per line) e.g. <code>https://fonts.gstatic.com</code> <input type="text"/>
🔧 Critical CSS (advanced)

Preload / Preconnect — resource hints for fonts and origins

Critical CSS (advanced) optional

Inline above-the-fold CSS into the page `<head>`. Advanced and off by default.

- **Inline critical CSS (invasive)** — off by default; inlines the CSS below into the head.
- **Above-the-fold CSS** — the CSS to inline. Leave empty unless you know what to extract.

Inline critical CSS (invasive)
Off by default. Inlines the CSS below into the `<head>`.

Above-the-fold CSS

Database maintenance thresholds

Critical CSS — inline your above-the-fold styles

Database maintenance thresholds

How old transient data must be before the cleanup tool touches it.

- **Abandoned carts older than (days)**
- **Connections/guests older than (days)**
- **Log rows older than (days)**

Each value is between 7 and 3650 days. These thresholds drive the cleanup tool further down the page.

Abandoned carts older than (days) <input style="width: 60px;" type="text" value="30"/>	Connections/guests older than (days) <input style="width: 60px;" type="text" value="30"/>	Log rows older than (days) <input style="width: 60px;" type="text" value="30"/>
--	---	---

Save settings

Database maintenance thresholds — age limits for transient data

Actions

One-click maintenance buttons.

- **Clear WebP cache** — removes the generated WebP files.
- **Regenerate WebP (batch 500)** — pre-generates WebP for up to 500 images at a time.
- **Write / Remove browser-cache rules** — writes the cache rules into `.htaccess` inside a reversible `# BEGIN/END cll_perf` block (a one-time `.htaccess.cll_perf-bak` backup is created). GZIP/Brotli are enabled where the Apache module is present.

Clear WebP cache Regenerate WebP (batch 500) Write browser-cache rules to .htaccess

The `.htaccess` rules are written in a reversible `"# BEGIN/END cll_perf"` block and a one-time backup (`.htaccess.cll_perf-bak`) is created. GZIP/Brotli are enabled where the Apache module is present.

Database cleanup (maintenance)

Actions — WebP cache and browser-cache `.htaccess` rules

Database cleanup (maintenance)

A non-destructive cleanup of transient data. This is **not** a shop "maintenance mode": your front office stays online and visitors are never blocked.

- **Execute (otherwise dry-run)** — leave unticked to preview; nothing is deleted until you tick it.
- **Also OPTIMIZE TABLE** — optionally reclaim table space after cleanup.
- **Run maintenance** — only transient guest/log data older than your thresholds is affected; valid orders and customers are never touched.

This is a non-destructive database cleanup. It is NOT a shop "maintenance mode": your front office stays online and visitors are never blocked.

Always run a dry-run first. Nothing is deleted unless you tick "Execute". Only transient guest/log data older than the configured thresholds is affected; valid orders and customers are never touched.

Execute (otherwise dry-run) Also OPTIMIZE TABLE

▶ Run maintenance

Database cleanup — always dry-run first, then execute

3. Check that it works

- Open the *Status* panel: the master switch should be ON and the WebP engine should be "available".
- With "Serve WebP" on, view a product page source — images should be wrapped in `<picture>` with a `.webp` source.
- Run the database cleanup as a *dry-run* first: it reports how many carts, connections and log rows *would* be removed before you execute.
- After writing the browser-cache rules, check your `.htaccess` for the `# BEGIN cll_perf` block.

4. FAQ

Could an optimization break my theme?

The "invasive" options (combine CSS/JS, minify HTML, critical CSS) are off by default. Turn them on one at a time and test; use the Exclusions list to skip any problematic asset.

What if my server cannot make WebP?

The Status panel tells you. If neither GD nor Imagick is available, WebP rewriting is simply skipped and the original images are served.

Is the database cleanup safe?

Yes. It is non-destructive, always offers a dry-run, and only removes transient guest/log data older than your thresholds — never valid orders or customers.

Do I need to edit my theme?

No. Performance works through standard hooks and is compatible with any theme.
